Frame 1

Frame 2

Frame 3

Frame 4

1. Description of the game
2. Policy: …
3. The chosen action
4. Values of input variables and the gradient of action log-likelihood w.r.t input variables

The decision to move "up" by the agent in this instance seems to be a strategic response primarily influenced by the need to position the paddle in accordance with the ball's vertical position and the agent's current position, with some influence from the opponent's positioning. This action would increase the likelihood of successfully intercepting or hitting the ball, thereby potentially earning a point or at least effectively defending against the opponent's shot.
